01 Introduction

Two or three sentences: the problem, why it matters to the field, and the gap this work fills. Body text stays at 30 pt — it is read by someone standing in front of the poster, not leaning in.

- State the question you answered
- Give the one number that frames it
- Say what was missing before

02 Methods

Only what a visitor needs to trust the result: process, precursors, conditions. The full recipe belongs in the paper.

Figure 1 · free · 243 × 473 mm

Figure 1. Process schematic or reactor layout.

03 Results

Lead with the finding. One claim per figure, and the claim in the caption, so the poster still reads with the text skipped.

Figure 2 · 16:9 · 243 × 137 mm

Figure 2. The main result, as large as it can be.

Point out what to look at in Figure 2 — the axis, the trend, the crossover. Visitors will not find it on their own.

Figure 3 · free · 243 × 442 mm

Figure 3. Supporting data.

04 Discussion

What the result means, and how it compares with what was known. Keep it to the comparison the figure below shows.

Figure 4 · free · 243 × 451 mm

Figure 4. Comparison with prior work or a control.

05 Conclusion

- The finding, in one sentence
- What it changes for the field
- What comes next
