01 Introduction

Two or three sentences: the problem, why it matters, and the gap this work fills. Body text is 28 pt and never goes below 24 pt — it is read by someone standing a step back from the poster.

- State the question you answered
- Give the one number that frames it
- Say what was missing before

02 Experimental

Only what a visitor needs to trust the result: process, precursors, conditions. The full recipe belongs in the paper.

Figure 1 · 3:1 · 342 × 114 mm

Figure 1. Process sequence, one step per panel.

Figure 2 · 342 × 403 mm

Figure 2. Reactor or device schematic.

03 Results and Discussion

A. Lead with the main finding

One claim per figure, and the claim in the caption, so the poster still reads with the text skipped.

Figure 3a · 4:3 · 165 × 124 mm

Figure 3b · 4:3 · 165 × 124 mm

Figure 3. (a) The measurement. (b) The control, on the same axes.

B. Then what supports it

Point out what to look at — the axis, the trend, the crossover. Visitors will not find it on their own.

Figure 4 · 342 × 263 mm

Figure 4. Supporting data or comparison with prior work.

04 Conclusion

- The finding, in one sentence
- What it changes for the field
- What comes next
